

## **Marshall Electronics VSW-2200 Version 3.5 Application / Firmware Update**

The file VSW-2200 3-5 will install an updated version of the Control Application for the Marshall Electronics VSW-2200 video switcher. This application is designed to run on any Windows-based computer from XP through Windows 10.

### **What Does This Update Do?**

This update improves the Quad Split Preview output of the switcher by eliminating the switcher status overlay. The switcher status can still be displayed at any time by pressing the Info button on the IR remote control.

### **Installing the Control Application**

Double-click the file to start the installer. Please be sure to check the "Create Desktop Icon" check box during the install. This Installer does not remove older versions of the Control Application. Normally, it is best practice to remove older versions unless you expect to connect to and operate switchers with different firmware versions.

### **Updating the Firmware**

Once the new Control Application is installed the firmware in the switcher should be updated to match or results will be unpredictable.

To Update the switcher Firmware, first connect the computer to the switcher via a USB-mini cable. Follow the procedure in the Operations Manual for USB connection.

Once the connection has been established, select the Settings button, select the Utilities tab then click the Firmware Update button. Click Update.

A screen will pop up showing the update progress.

**Please allow at least 3 minutes AFTER the update appears to have completed. The switcher will restart two more times before the update is completely finished.**
